- » Total antioxidant capacity
- » Near-infrared spectroscopy
- » Results
- » Conclusion and outlook

Gluten-free grains – What is that?

- » Gluten-free-crops: corn, millet, rice, some oats
- » Pseudocereals: buckwheat, quinoa, amaranth

Gluten-free grains – Why analyse

- » Little is known about the chemical profiles of different cultivars
- » Often inferior nutraceutical properties than wheat
- » Better the diet of coeliac patients

Gluten-free grains – RE-Cereal Project

» Aims

- Higher quality of gluten-free products (mainly millet and buckwheat)
- Breed new, better cultivars of millet and buckwheat
- Optimize quality control and quality analysis

» Project partners

- Breeders
- Universities
- Producers

EUROPEAN UNION

Gluten-free grains – Samples

» 77 samples

- 40 buckwheat
- 31 millet
- 6 oat

Millet

Buckwheat

Oat

Content

- » Gluten-free grains
- » Total antioxidant capacity
- » Near-infrared spectroscopy
- » Results
- » Conclusion and outlook

Total antioxidant capacity (TAC)

- » Sum parameter
- » Antioxidants
 - Molecules which inhibit oxidation or reactions promoted by oxygen.
 - Prevent or reduce oxidative stress (reactions with lipids, proteins, DNA)
 - Help reduce risk of cardiovascular diseases, chronic inflammations, cancer
 - Vitamins, polyphenols, phenolic acids
- » Oxidative stability

Total antioxidant capacity (TAC) – Analysis (I)

- » Samples were milled before analysis
- » Extraction
 - 1g of milled sample
 - Acidified methanol [95% methanol, 5% hydrochloric acid (37%)]
- » Extraction cycle (6/9 times)
 - Ultrasonic bath at 60°C for 20 minutes
 - Centrifuge (3500 rpm, 5 min)

Total antioxidant capacity (TAC) – Analysis (II)

- » Various assays, all use redox reactions
- » Folin-Ciocalteu
 - Mixture of phosphomolybdate and phosphotungstate
 - Reduction of Mo(VI) to Mo(V) under basic conditions
 - Blue coloured complex: 750 nm
- » Reference: gallic acid

Content

- » Gluten-free grains
- » Total antioxidant capacity
- » Near-infrared spectroscopy
- » Results
- » Conclusion and outlook

Near-infrared spectroscopy – Advantages

- » Fast
- » Rather cheap
- » No chemicals
- » Miniaturized technology available

Near-infrared spectroscopy – Measurements

- » 4 devices
 - 1 benchtop
 - 3 handheld
- » Measurements of milled and intact samples
- » Cylindrical quartz cuvette (h=25 mm, \emptyset =31.6 mm)

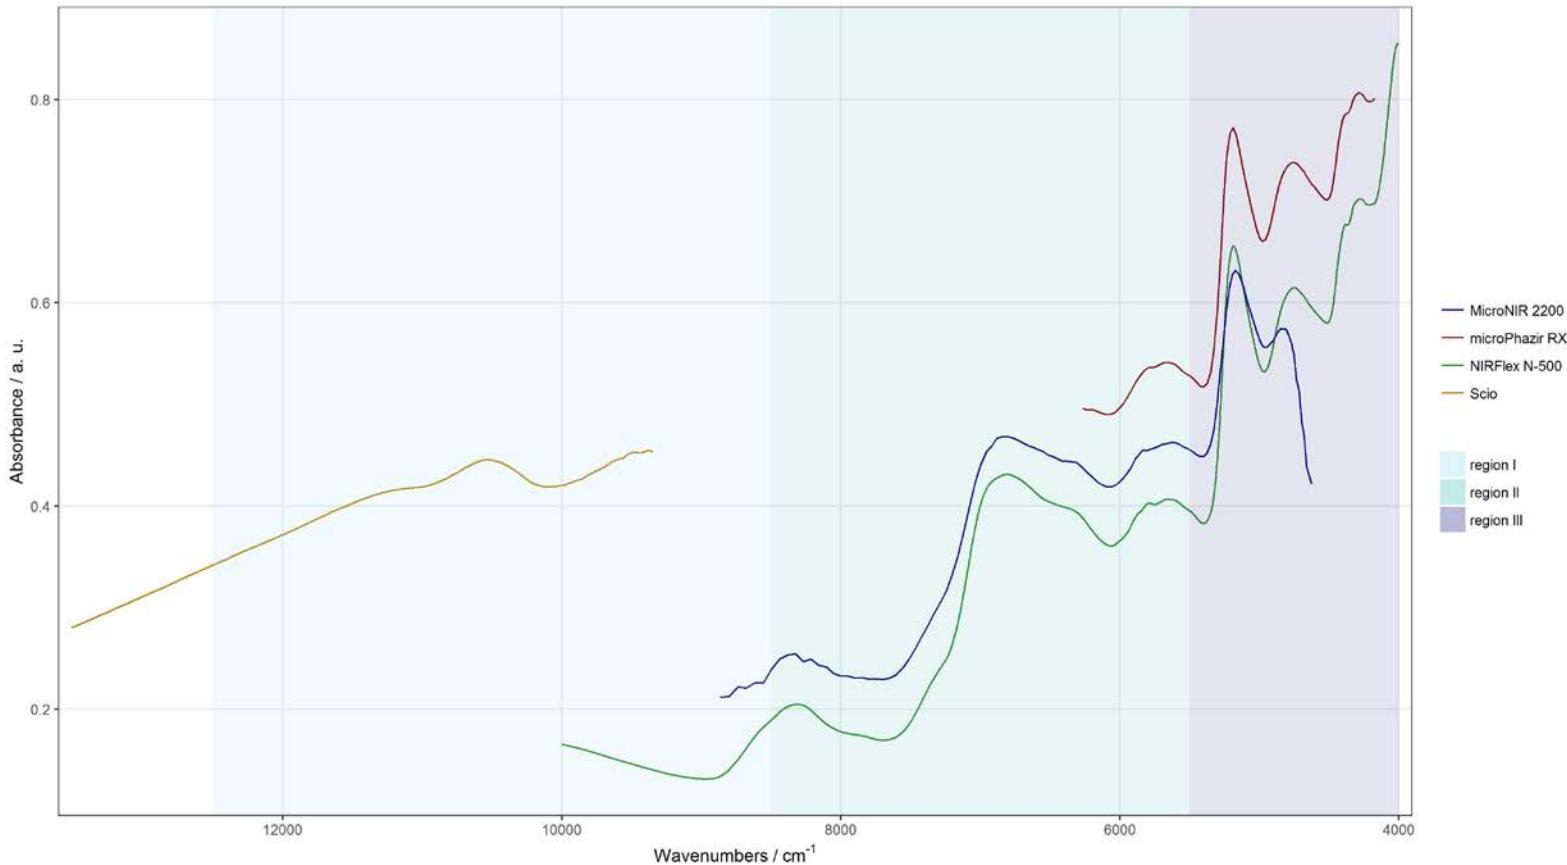

Near-infrared spectroscopy – Instruments (I)

Near-infrared spectroscopy – Instruments (II)

Instrument	Wavenumber range / cm ⁻¹	Wavelength range / nm	(Average) Resolution / cm ⁻¹	Number of data points
NIRFlex N-500 (Büchi)	10.000–4.000	1.000–2.500	8	1501
microPhazir RX (Thermo Fischer)	6.270–4.180	1.600–2.400	21	100
MicroNIR 2200 (Viavi)	8.870–4.630	1.130–2.160	33	128
SCiO (Consumer Physics)	13.514–9.346	740–1.070	13	331

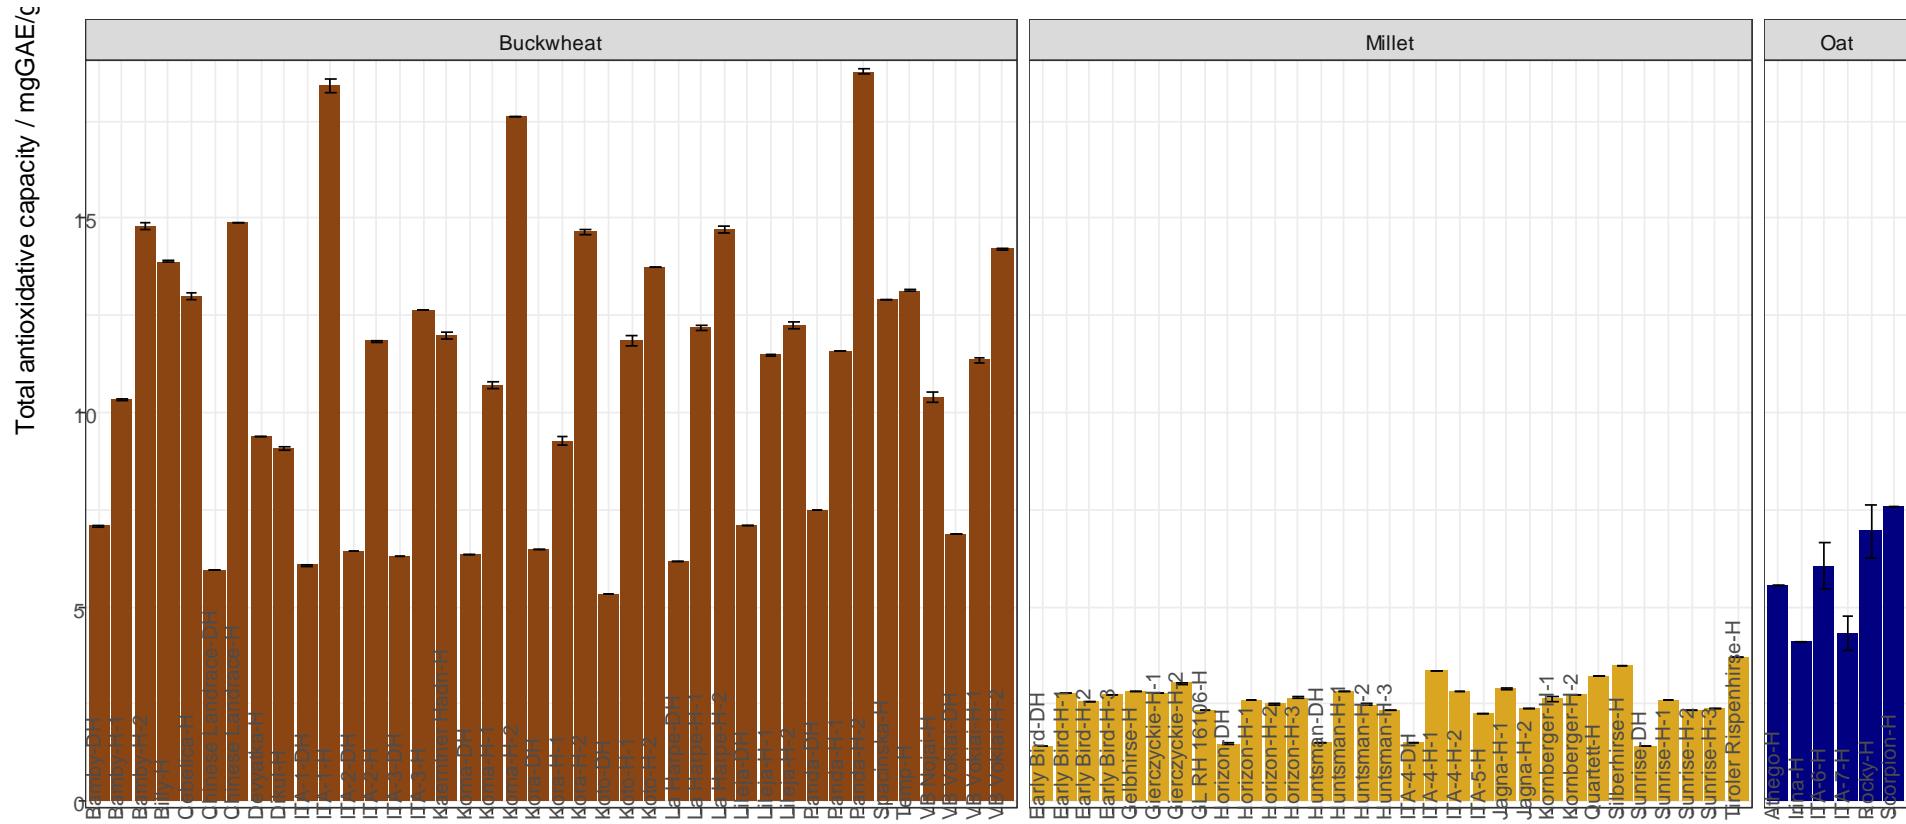

Near-infrared spectroscopy – Spectral ranges

Content

- » Gluten-free grains
- » Total antioxidant capacity
- » Near-infrared spectroscopy
- » Results
- » Conclusion and outlook

Conclusion (I)

- » NIR can be used for TAC estimation with limitation
 - Millet samples range: 1.4–3.7 mgGAE/g
 - Oat samples range: 4.1–7.6 mgGAE/g
 - Buckwheat samples range: 5.3–18.8 mgGAE/g

- RMSEP range: 1.02–1.86 mgGAE/g
- LOD_{max} range: 1.72–3.23 mgGAE/g
- LOQ_{max} range: 5.15–9.69 mgGAE/g

Conclusion (II)

- » Resolution is not all
 - MicroNIR 2200 worst resolution, but good results
- » Handheld spectrometer perform similarly to benchtop
 - Benchtop results are more stable in regards to milled/intact
 - Benchtop performs best at multivariate LOD/LOQ

Outlook

» Publication

- Verena, Wiedemair; Huck, Christian W. (2018): Evaluation of the performance of three hand-held near-infrared spectrometer through investigation of total antioxidant capacity in gluten-free grains. In: *Talanta*. DOI: 10.1016/j.talanta.2018.06.056.

» Look at other parameters of gluten-free grains
